Python Exercise 6 & 7 Report

Siyuan Peng

January 18, 2021

I think you have done a good job! Check the feedback below and try fixing the mistakes.

For 3.1.1, Correct! No matter what function returns, it always return one item. If it returns nothing, it means `None` is returned. If it returns multiple items, it means a tuple is returned.

For 3.1.2, it essentially returns `None`.

For 3.2.1, note that `print` function does not return anything but prints it on the terminal. To see if a function returns anything, try this `var = print(1); print(var)` in Python. If the second line prints `None`, it means the `print()` function did not return anything.

For 3.2.2, think about this today as well and see if you can come up with an answer.

For 3.2.3, again, `print()` will not return values. But the answers are correct.

For 3.3.2, there is smooth way to return the True and False! Think about this today as well.

For 3.3.3, I believe there are some mistakes. Have you tried this code in VS Code?

For 3.4.2, you don't need to declare variable `i` before the `for` loop because it will be defined as the loop index.
